One spreadsheet. Three guardrails.

Can the report still be written if the source stays untouched?

THE JOB

Count the shipment rows and save a report.

THE TEST

Run the same four commands with the guardrails off and on.

Protect the original

The command tried to append a line to a disposable copy of the CSV.

GUARDRAILS OFF

The append succeeded.

GUARDRAILS ON

The append failed. The CSV fingerprint stayed the same.

Give it the exact path

A dummy private note sat outside the output folder. The command knew where it was.

GUARDRAILS OFF

The command read the note.

GUARDRAILS ON

The read failed. This rule protected that note, not the whole Mac.

Test the connection

A harmless endpoint listened on the same Mac. The request carried no shipment data.

GUARDRAILS OFF

The endpoint answered.

GUARDRAILS ON

The request failed. No internet upload was tested.

Keep the useful result

The report still said 198 shipment rows with the guardrails on.

TRY IT

Run the demo from the AI Starter Kit on a Mac.

WHAT THIS SHOWS

The commands ran under a policy. No model chose them.
